Tutorial 08;

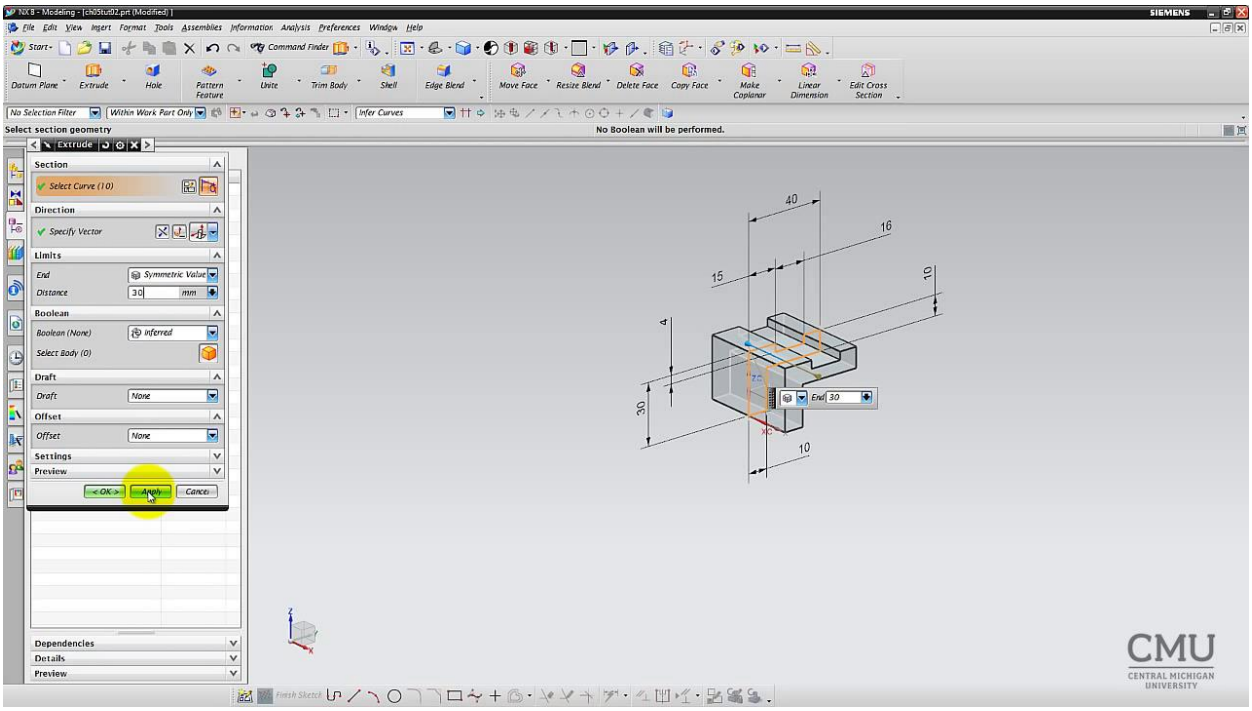

- Create a sketch environment in the plane as shown in the diagram below

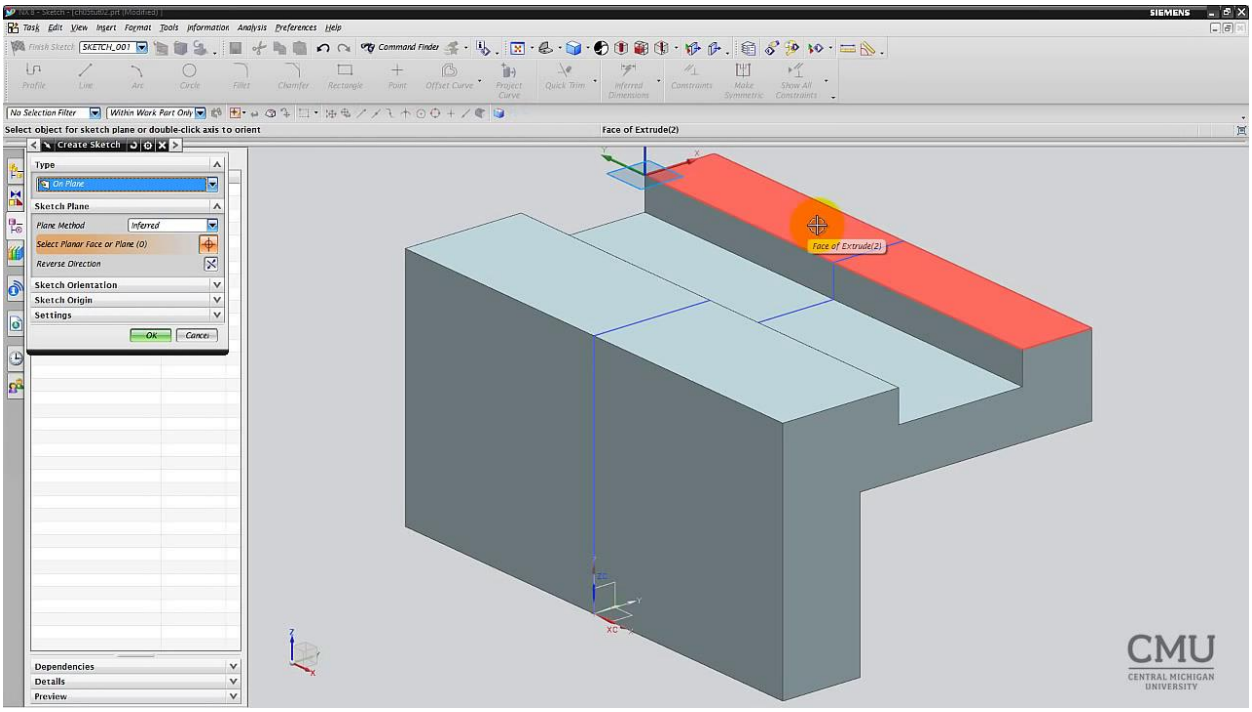

- Reproduce the below diagram in the sketch environment

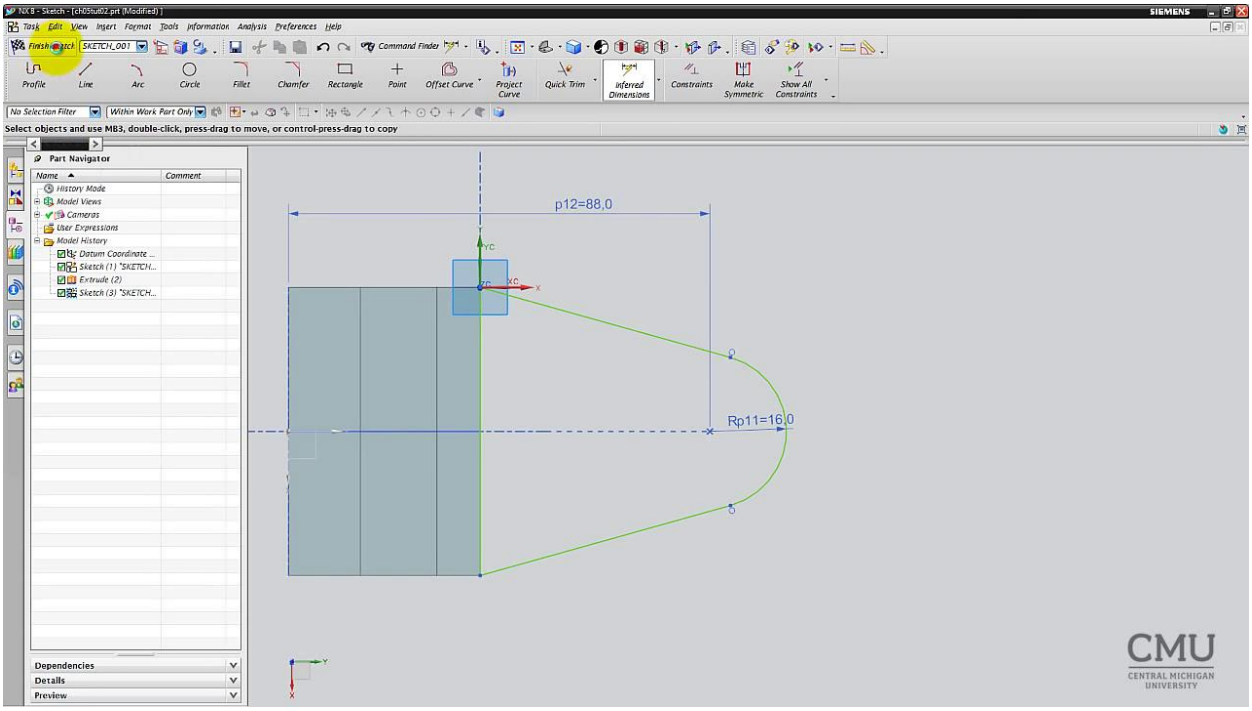

- Exit the sketch environment and extrude the generate sketch as shown in the diagram below.

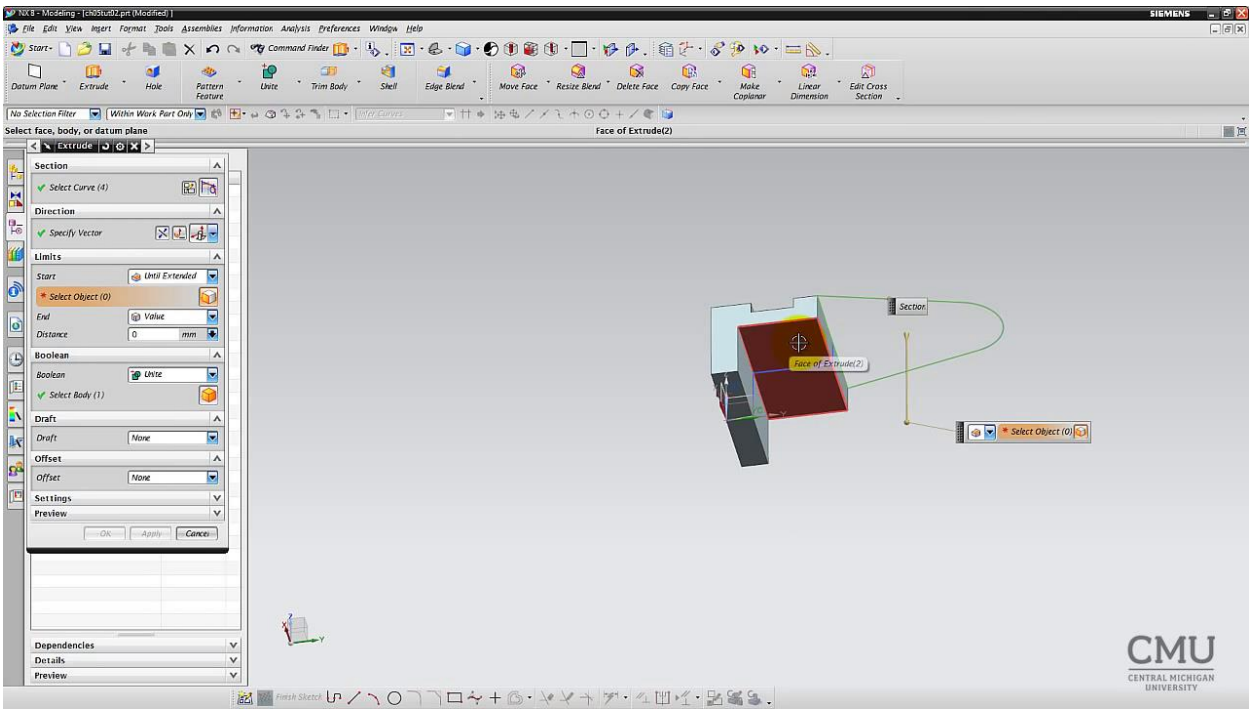

- Create another sketch layer on the top face as shown below

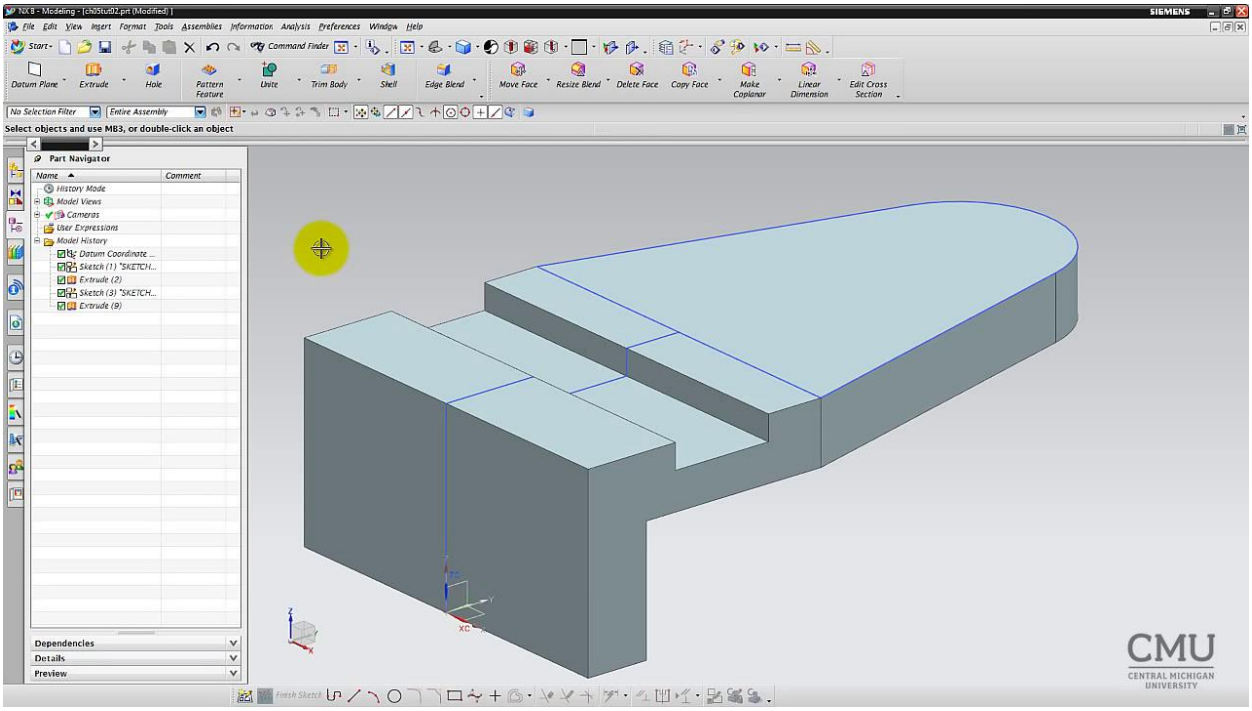

- Reproduce the sketch on the top face of the model as shown in the diagram below

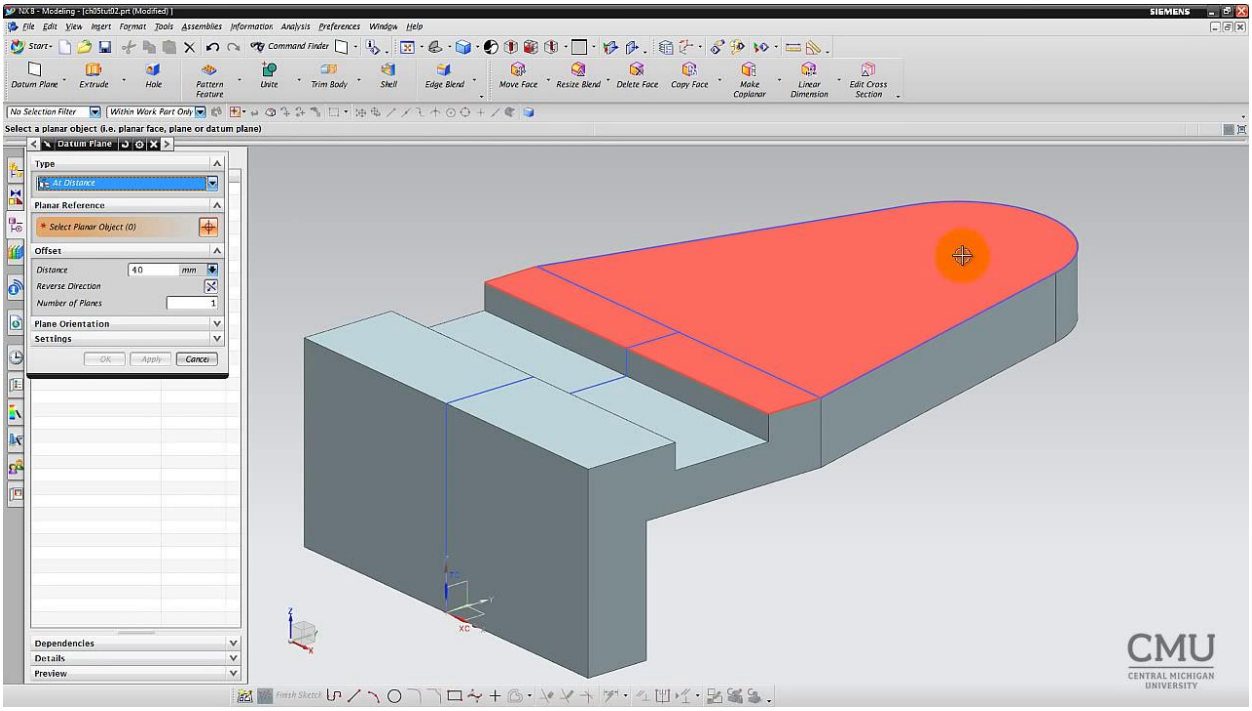

- Extrude the reproduced sketch using the options as shown in the dialogue box below

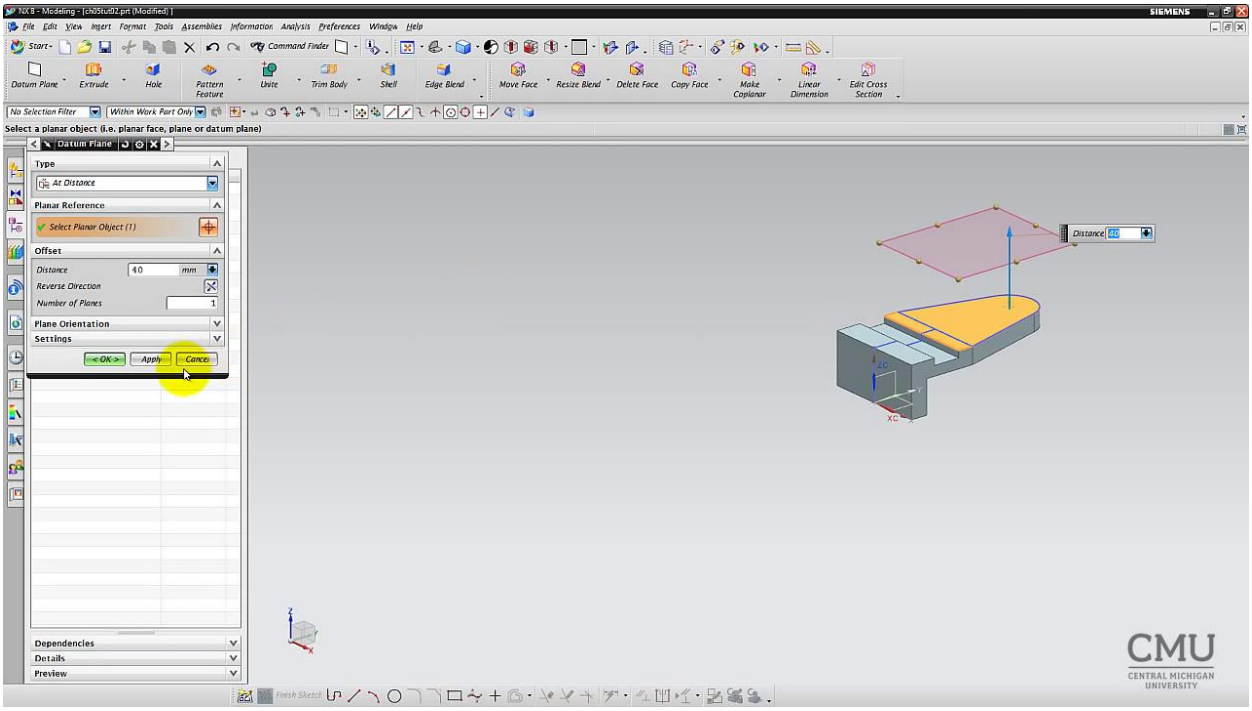

- The resulting model should be as below

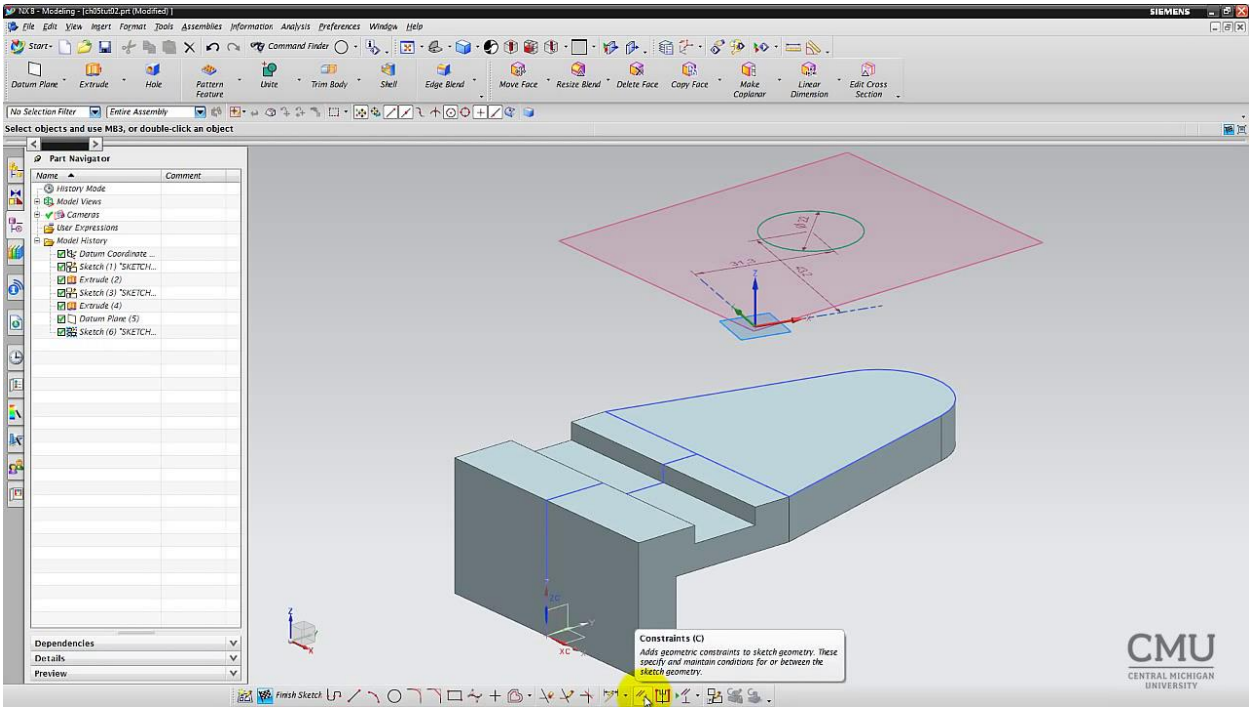

- Insert a datum plane at a distance from the top face of the model

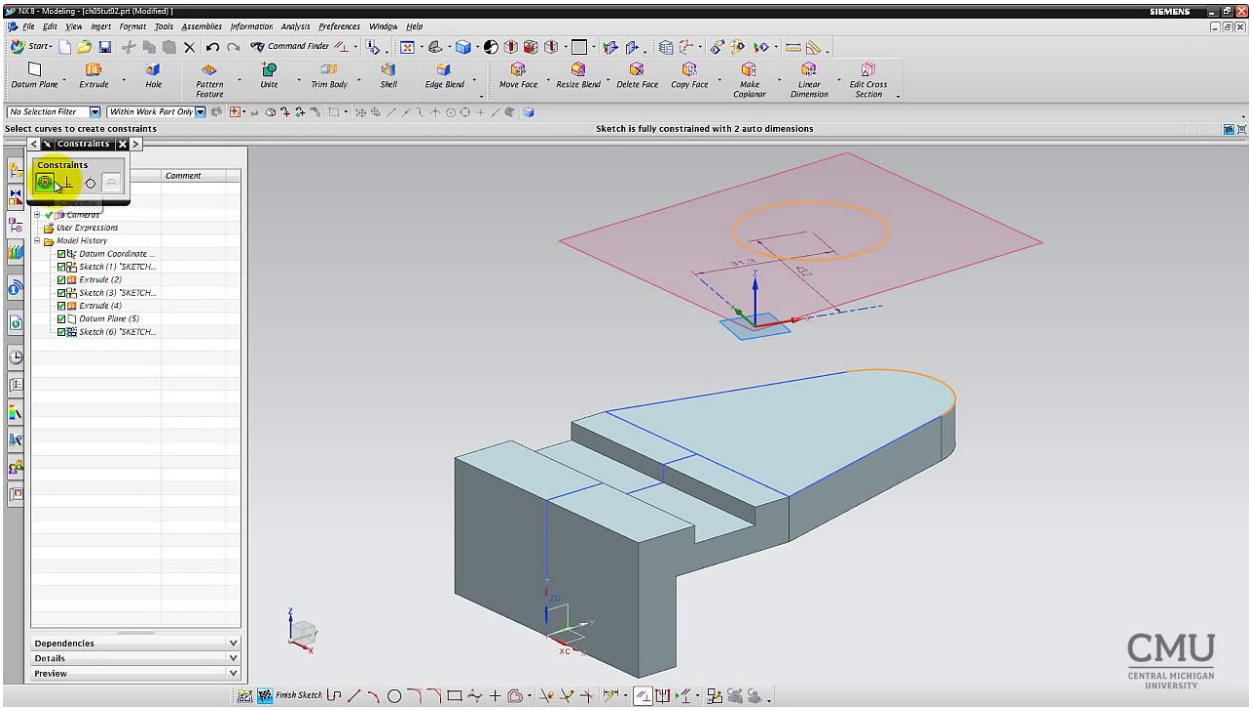

- Use the parameters in the diagram to create the datum plane

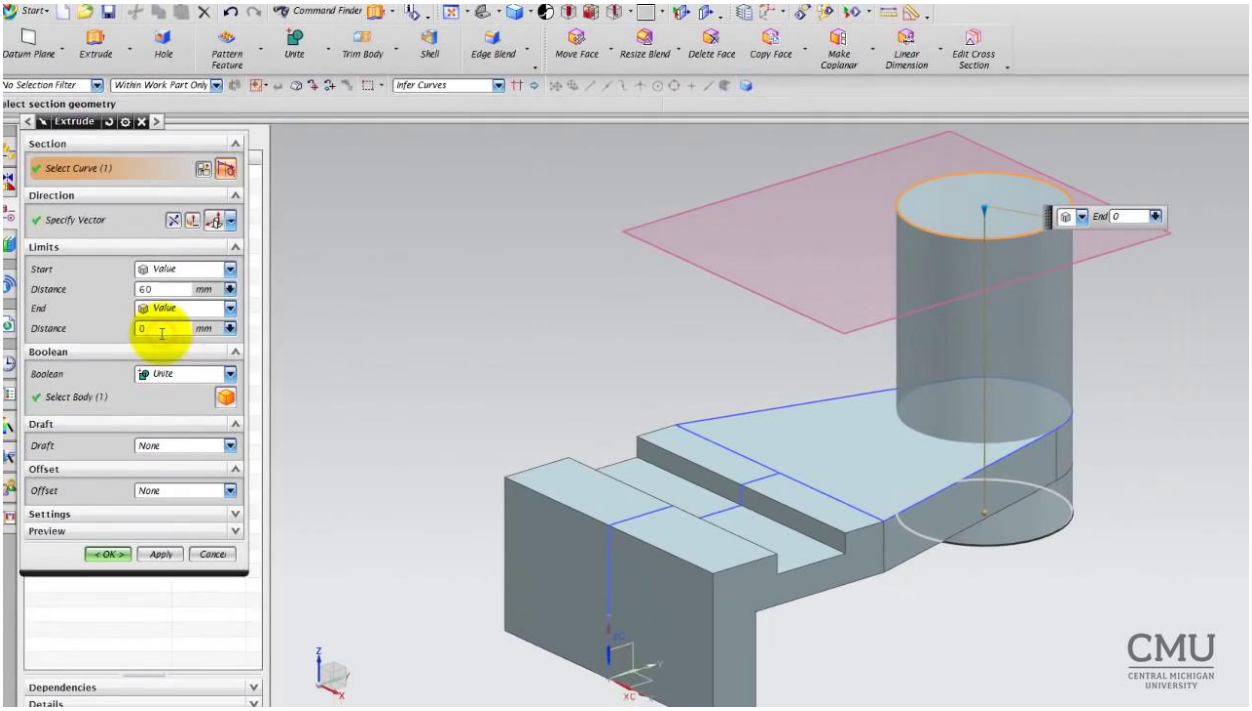

- Insert a sketch on the datum place as shown below

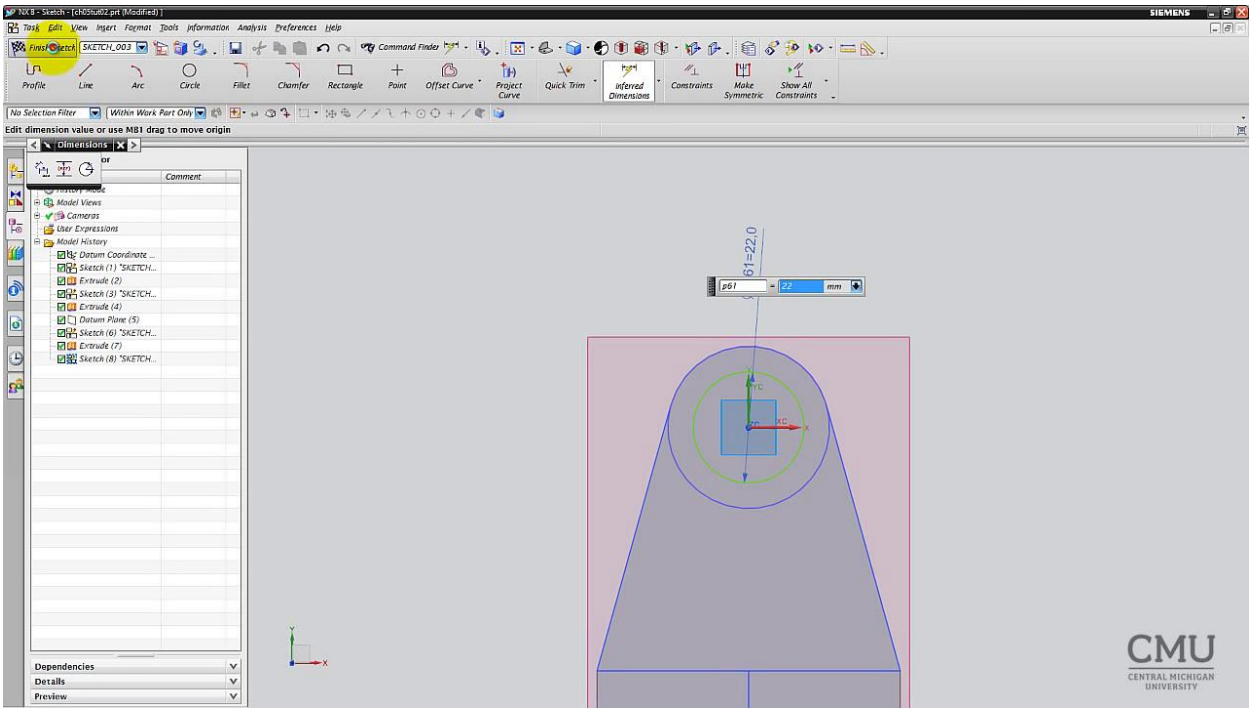

- Constrain the circle on the datum plan with the arc on the model using concentricity

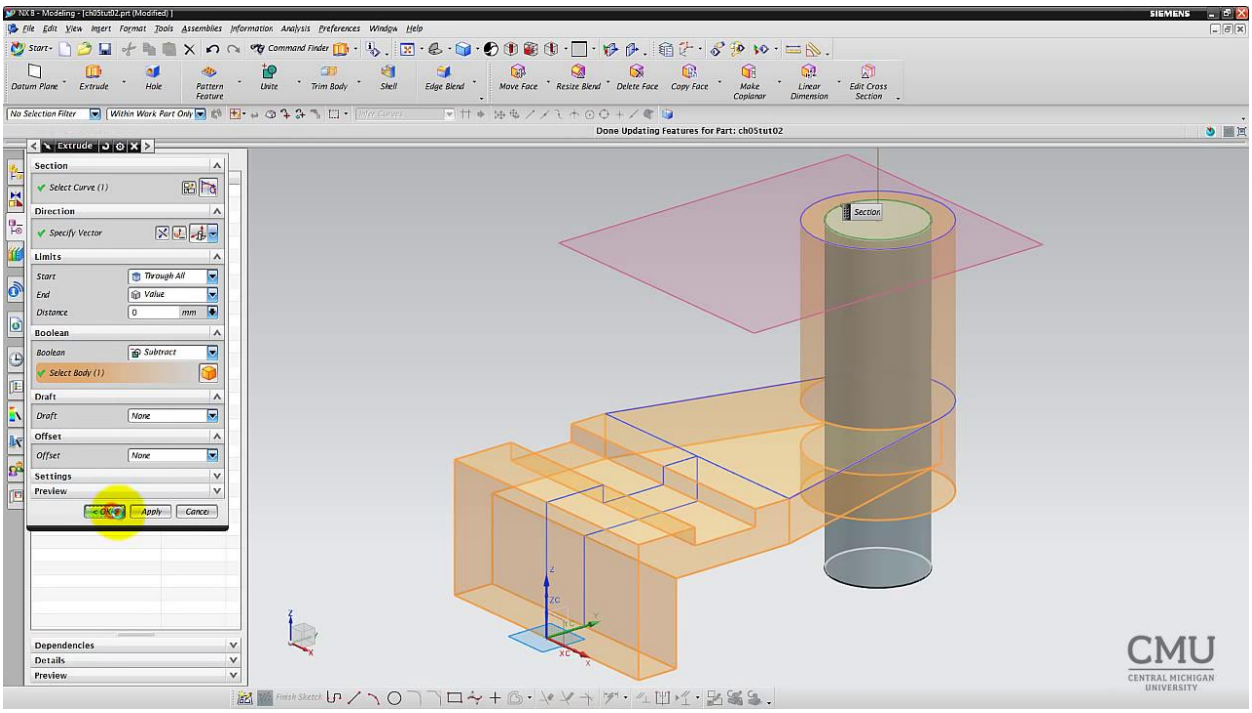

- Extrude the sketch and unite it to the existing model

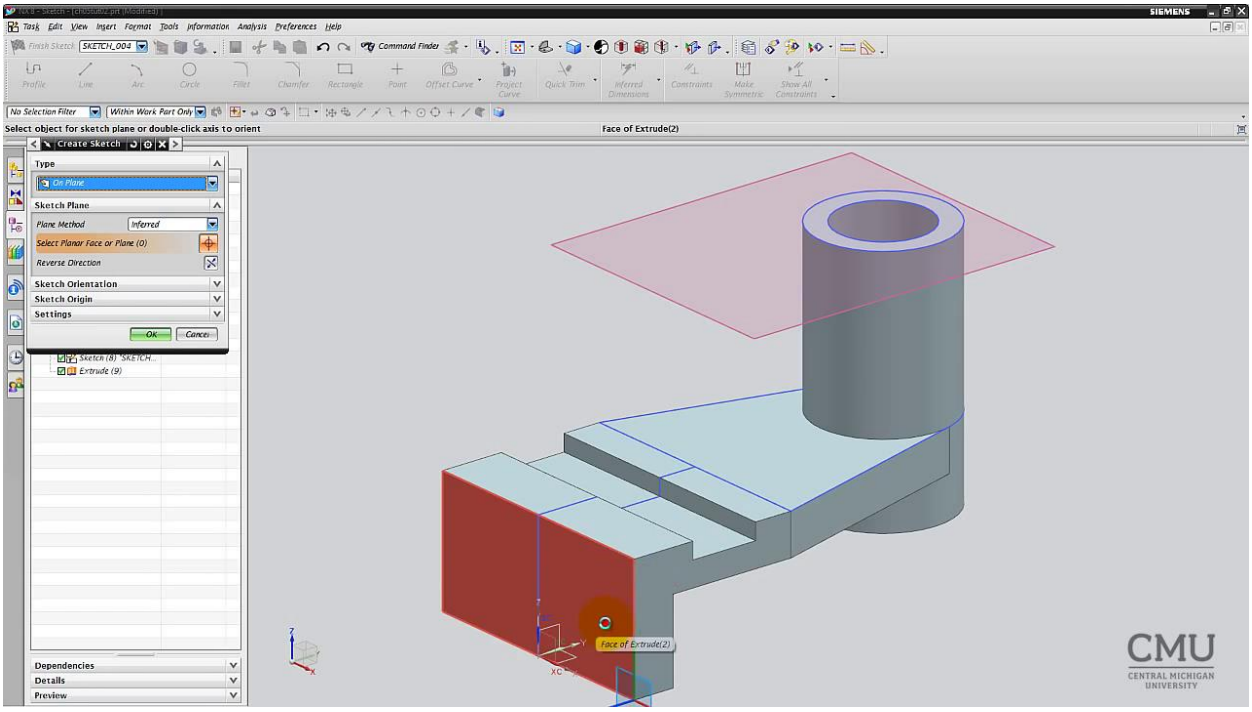

- Insert another sketch on the either the datum plane created or the top face of the generated cylinder from the previous sketch as shown below.

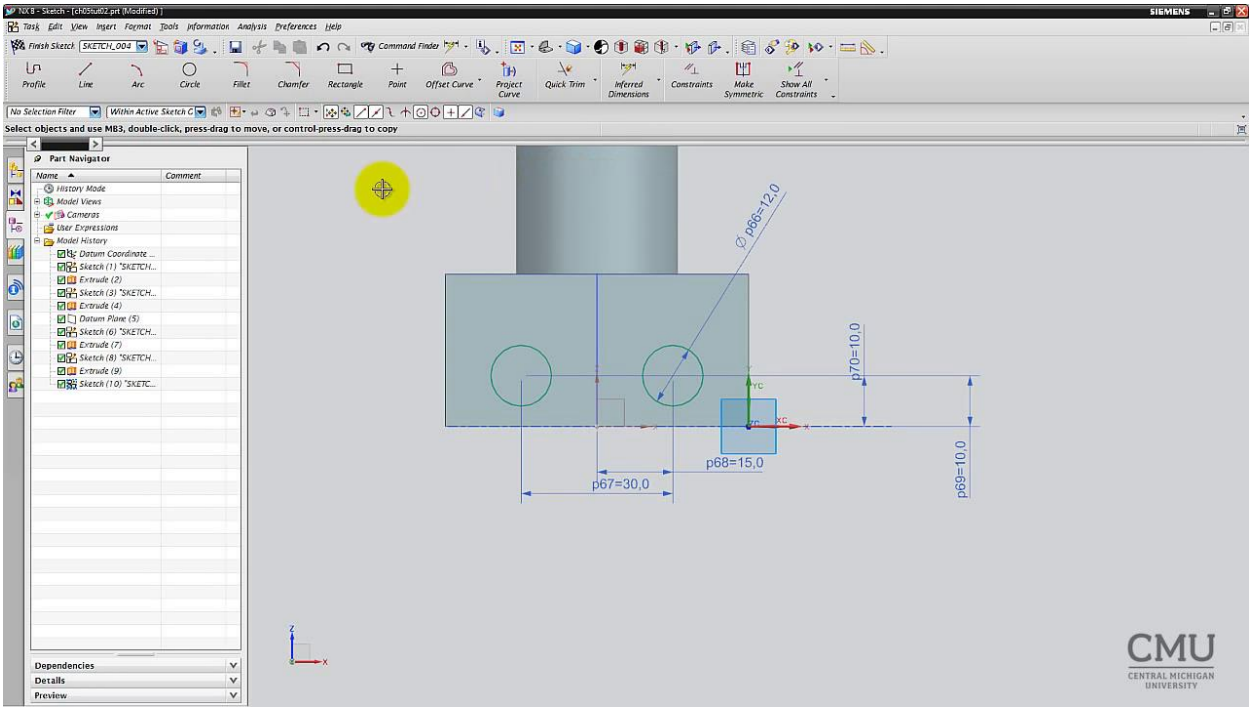

- Extrude and subtract this new sketch from the cylindrical part

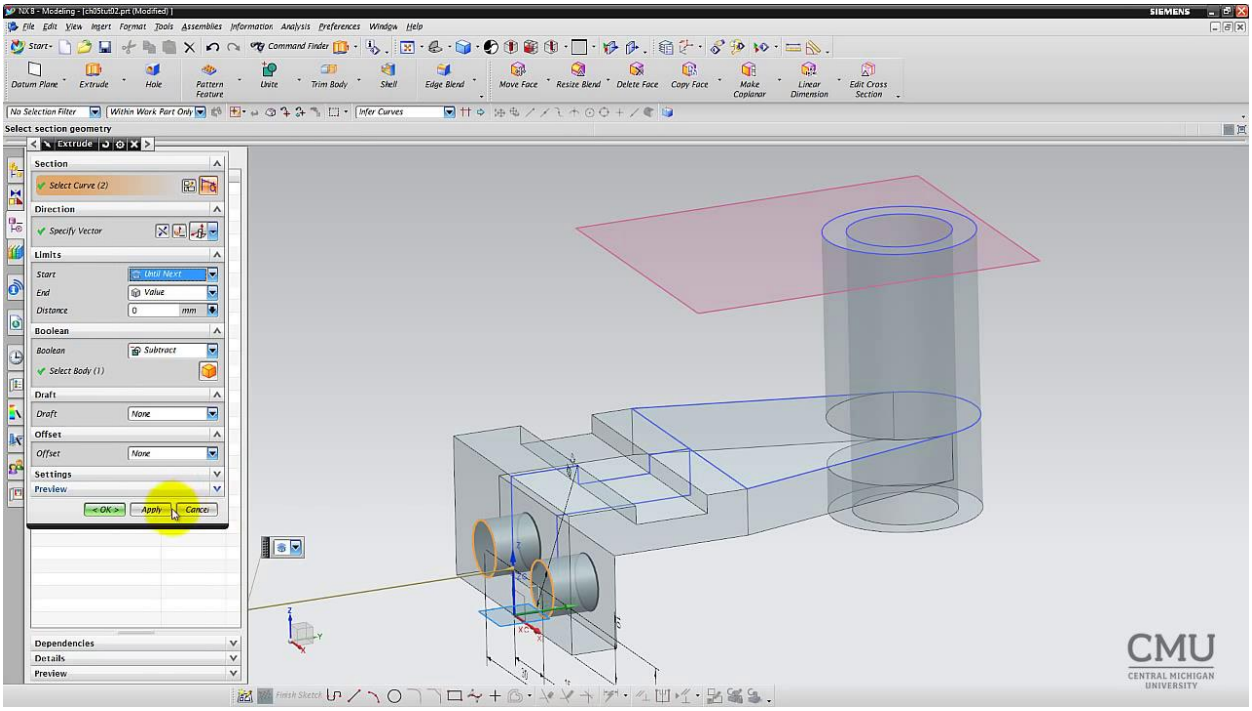

- Insert a sketch environment on the left side of the resulting part

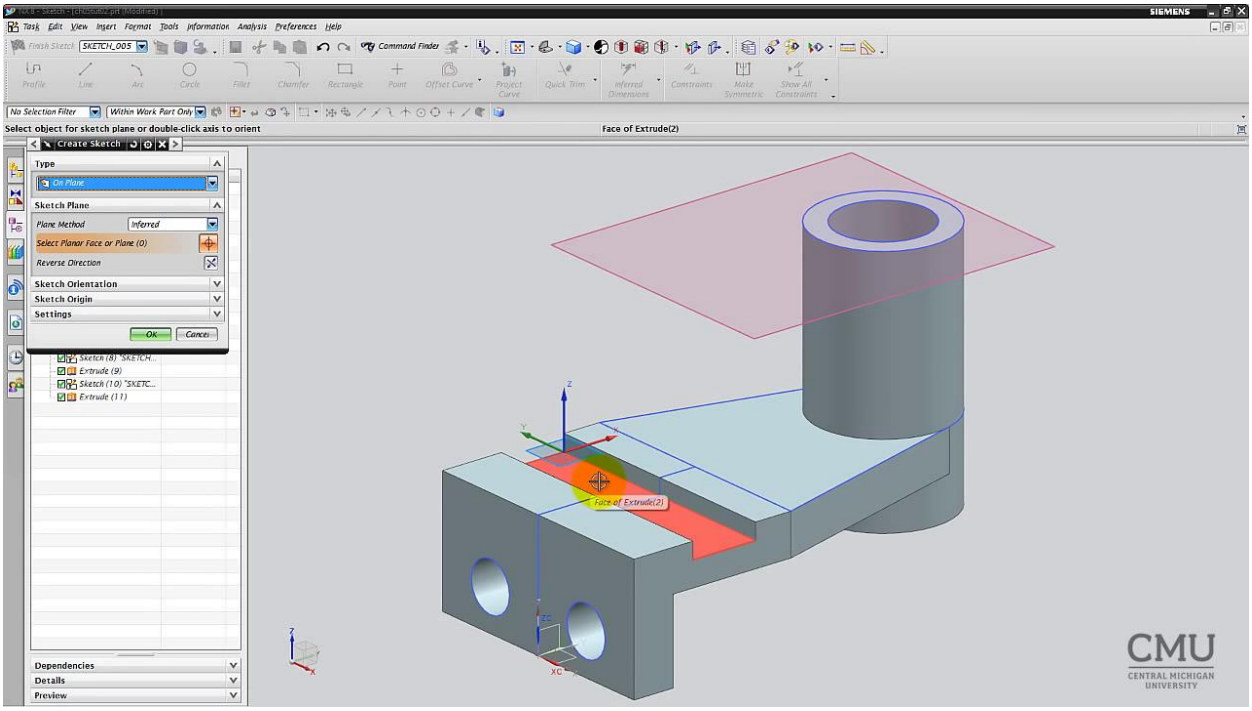

- Reproduce the sketch shown in the diagram below

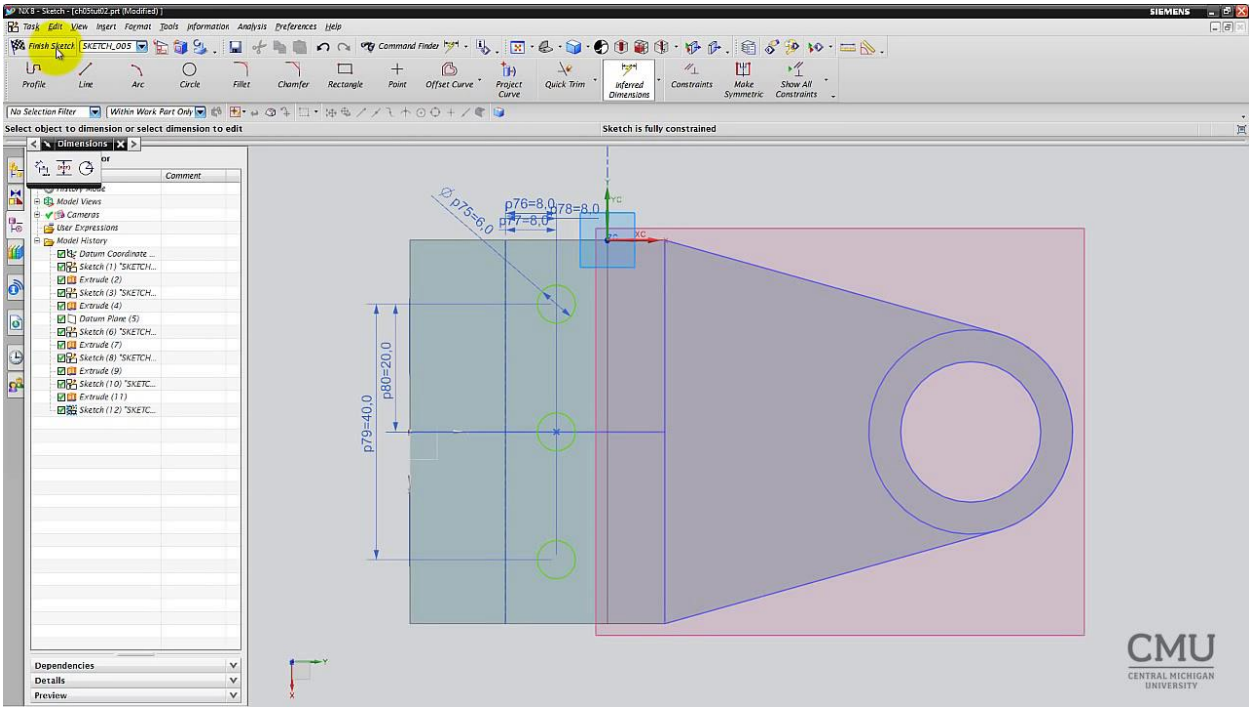

- Extrude and subtract the sketch from the model

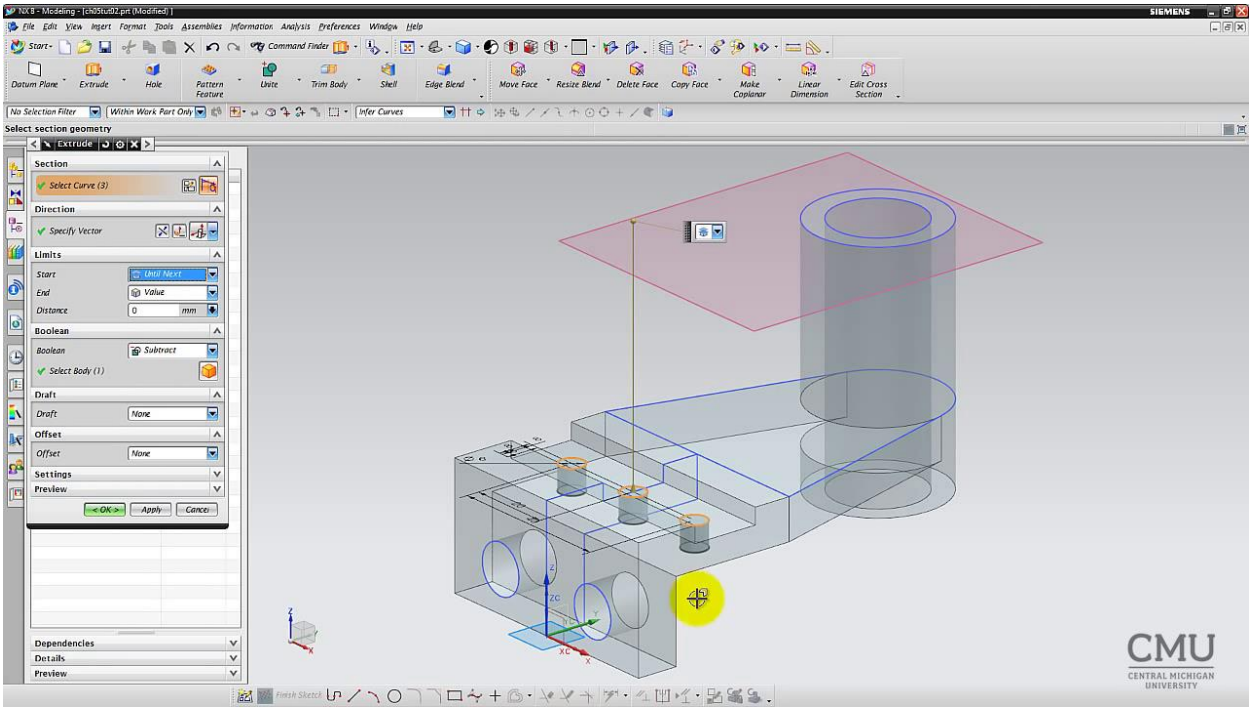

- Insert a sketch layer on the top face as shown below

- Reproduce the sketch as shown below

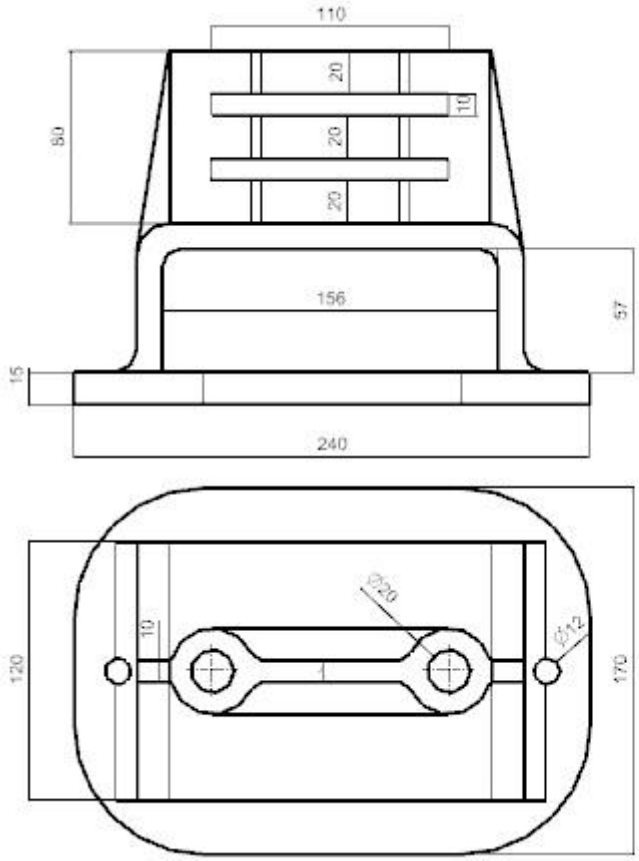

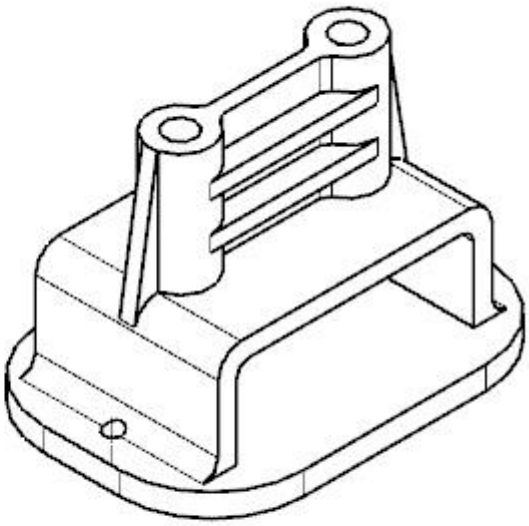

- Extrude and subtract from the model as shown

- The final part should be as in the diagram below
- Save the part as ”tut12”

ASSIGNMENT 08

All filets have radii of 8 units
